

Infinite Shop Sales

Data Story & Analysis Report

Prepared by Joseph Mugo Nyambura · September 2026

Executive Summary

Between January 2024 and September 2026, Infinite Shop generated KES 13,895,446 in net sales across 9,000 orders and 65,132 units sold. This report tells the story behind those numbers: what is driving revenue, where the business is balanced, where it is concentrated, and one data-quality issue worth fixing before the next analysis cycle.

KES 13.9M Net Sales	9,000 Total Orders	65,132 Units Sold	1.1% Discount Impact
-------------------------------	------------------------------	-----------------------------	--------------------------------

1. Category Performance: A Concentrated Business

Household products lead all categories by a wide margin, generating KES 5.77M — more than Groceries and Electronics combined. Within that category, one single product stands out: Cooking Gas Refill 6kg accounts for KES 3.39M on its own, roughly 24% of total net sales across the entire business.

Figure 1. Net sales by category — Household leads, driven almost entirely by one product.

This concentration is worth flagging as a risk rather than treated purely as a win: with a quarter of revenue tied to a single SKU, any disruption to its supply, pricing, or demand would have an outsized effect on total performance. Diversifying growth across more products — or building a deliberate strategy around this product's strength — are both reasonable responses; doing neither, and treating it as background noise, is the one option worth avoiding.

Figure 2. Top 8 products by net sales — Cooking Gas Refill 6kg leads by a wide margin.

2. Regional Performance: Balanced, Not Lopsided

Unlike category performance, revenue across the six regions is remarkably even. Thika leads at KES 2.43M and Nakuru trails at KES 2.16M — a spread of only about 12% between the strongest and weakest region.

Figure 3. Net sales by region — no single region dominates or lags significantly.

The practical implication: there is no single underperforming region to fix. Any push for regional growth should focus on lifting the whole footprint together, rather than searching for one weak link that isn't really there.

3. Monthly Trend: A Partial Year, Not a Decline

Net sales average roughly KES 402,700 per month, with no strong seasonal pattern across the period. The most recent months (highlighted below) show a drop-off — but this reflects that the 2026 data only extends through September, not a genuine decline in the business. Reading this as a downward trend would be a misinterpretation of an incomplete final period.

Figure 4. Monthly net sales trend. Shaded region marks the incomplete final month of data.

4. Payment Method: An Even Three-Way Split

Customers pay almost equally across M-Pesa (3,079 orders), Cash (2,981), and Card (2,940). No channel dominates, which suggests infrastructure and staffing should continue supporting all three payment types equally rather than prioritizing one.

Figure 5. Payment method distribution across all orders.

5. Discounting: A Minor Lever, Currently

Only 9.5% of orders carried any discount, and the total value given away to discounts across the full period was KES 149,059 — just 1.1% of gross sales. Discounting is not currently a significant driver of, or drag on, revenue; if promotions are a strategic goal going forward, there is considerable room to expand this lever without much historical risk of margin erosion.

6. Data Quality Note

583 of 9,000 orders (6.5%) had a missing quantity or unit price, and net sales could not be calculated for those rows. Rather than estimating or dropping this information silently, it was preserved with the underlying record intact and simply excluded from revenue totals. This is disclosed here for transparency: the KES 13.9M figure represents complete records only, and the true total is very likely modestly higher.

Separately, an earlier pass at this data through a Power BI dashboard surfaced two additional inconsistencies not present in this report's source: a duplicated “Card” payment category and an “Unknown” region/category bucket. Both were artifacts of an unclean data source being loaded into that tool, and are not present in the analysis behind this report, which was built entirely from the verified, cleaned dataset.

Recommendations

- Treat Cooking Gas Refill 6kg as a strategic product: protect its supply chain and consider whether its success can be replicated in adjacent products, rather than letting revenue concentration go unmanaged.
- Continue balanced investment across all six regions — there is no underperforming region requiring urgent intervention.
- When reporting on 2026 performance, always caveat that the year is partial (through September) to avoid the trend being misread as decline.
- Maintain support for all three payment methods equally; consider a modest expansion of discount promotions given the low historical cost of discounting.
- Fix the 583 incomplete records at the point of sale/data entry to close the measurement gap in future reporting periods.

Methodology: Data was cleaned in Python (pandas) — duplicate and blank rows removed, payment method and region text standardized, dates parsed from five mixed formats, and prices/quantities converted from inconsistent text formats to numeric values. Net sales reflects quantity × unit price adjusted for discount.
